SMK (2.92mm) Connectors

SMK Connectors provide an excellent solution for applications requiring high frequency transmission. Similar to the SMA interface, a smaller internal body diameter (2.92mm) and air dielectric provide a higher cutoff frequency and other key advantages: • Superior electrical performance to 40GHz • Female contacts have a three-slot construction, which enhances connectivity • The Field Replacement Jacks with a high quality hermetic seal feed thru for use in sealed circuit modules • The SMK plug interface employs more precise dimensions than an SMA and uses a shorter snub nose male pin such that the connector bodies align before the contacts engage

FL (Finger-Lock) Series Coaxial Connectors:

Low-profile microminiature high-frequency connectors. The FL Series connectors are low-profile microminiature coaxial connectors intended for high-density packaging of components on printed circuit boards. The FL Series is ideal for high-density circuit board wiring in signal transmission applications at high frequencies up to 1GHz.

Features: High-level matching: Maximum V.S.W.R. is only 1.2 at frequencies up to 1GHz.

Applications: Typical applications include cellular telephones, radio communications equipment, electronic measuring instruments, CATV, control units, etc.

Material and Finish: • Shell: Brass or phosphor bronze, silver plating • Center contact (male): Brass, gold plating • Center contact (female): Phosphor bronze, gold plating • Insulation: Polybutylene terephthalate (PBT), black.

Performance Characteristics: • Characteristic impedance: 50Ω • Insulation resistance: 1000MΩ or more (at 250VDC) • Contact resistance: 10mΩ or less for both center and outer conductors (at 1 ADC) • Withstanding voltage: 250VAC (rms) for one minute • Coupling/removal force: 300 gf or more • Life of contacts: 50 times of use

S.FL2 Series Coaxial Connectors:

S.FL2 (Super FL Type 2 Coaxial Connector) Series is a surface mount, low profile, miniature coaxial connector intended for high density packaging. Compared to Hirose's FL Series connectors, the S.FL2 Series offers a 50% reduced profile when assembled, achieving increased density of internal wiring for high frequency transmission applications.

Features: Highly flexible, offers high frequency performance below V.S.W.R 1.2 over 0-2000MHz range.

H.FL Series Coaxial Connectors:

The H.FL connectors have a lower profile, with a mounted height of approximately 30% that of our S.FL2 connectors. They occupy 20% less board space, allowing higher density internal wiring.

Features: • High frequency response of V.S.W.R 1.3 or less from D.C. to 3000MHz.

Material and Treatment: • Shell: Phosphor bronze, silver plating • Insulator: PBT plastic (plug side), black; Liquid crystal polymer (receptacle side), black • Male center contact: Bronze, gold plating • Female center contact: Phosphor bronze, gold plating.

Performance Characteristics: • Characteristic impedance: 50Ω and 75Ω • Insulation resistance: 500MΩ or greater at DC 250V • Contact resistance: 20mΩ (center), 10mΩ (exterior) at DC 10mA • Dielectric strength: AC 300V (r.m.s), 1 minute • Contact service life: 50 times • Voltage standing wave ratio: 1.3 or less, DC to 3000MHz (target value)

FCI AirMax VS® High Speed Connector System

RoHS COMPLIANT

The AirMax VS® connector is a revolutionary connector system that offers scalability, flexibility, high density and headroom in performance. "VS" stands for Virtual Shield as this technology requires no interleaving shields. The elimination of these shields results in lower cost, lower weight and offers greater flexibility.

Features:
• Shieldless connector system • High pin density per module • Designed to fit HM (hard metric) building practice • No pre-assigned ground pins • Excellent electrical performance • Low weight and low mating forces

PCI Express™
Card Edge Connectors

These 1.0mm pitch, vertical card edge connectors are used to implement the evolutionary PCI Express strategy in ATX or ATX-based desktop PCs and server systems. The connector family offers 1 to 16 high-speed serial PCI Express Lanes. Each serial lane supports 2.5 Gbps data rate (per direction). The connector family supports x1, x4, x8, or x16 link widths to suit different bandwidth requirements. All connectors support the PCI Express signal and power requirements, as well as auxiliary signals at the interface between system board and add-in card hardware.

Materials: • Contact Base Metal: Copper alloy • Contact Area Finish: Gold over nickel • Solder Area Finish: Tin over nickel • Housing Material: High-temperature thermoplastic (UL 94V-0) Color: Black • Metal Board Locks: Copper alloy • Board Locks Finish: Tin over nickel **Electrical Performance:** • Contact Resistance: 30mΩ maximum initially with 10mΩ maximum change after environmental exposures • Current Rating: 1.1A minimum per pin for the 7 power pins and 7 nearest ground pins **Mechanical Performance:** • Durability Rating: 50 cycles minimum

SATA Connectors

Serial ATA (SATA) provides data speeds up to 3Gbits per second while utilizing a smaller number of contacts. SATA is the next generation standard interface for all mainstream storage, data, notebook, and desktop applications.

SATA provides many significant advantages over the current parallel ATA standard. Improved density, along with lower voltage transmission eliminates the requirement for bulky ribbon cables. The result is much better airflow through the device utilizing this interconnect. In addition, SATA utilizes a first mate, last break contact arrangement for hot plugging capability.

Advanced TCA Connectors

TECHNOLOGY IN CONNECTORS™

This newly developed architecture and system layout allows manufacturers of telecom equipment a new standard for designing systems (PICMG 3.0). ATCA stands for: Advanced Telecommunications Computing Architecture. The basic structure is utilizing a modular concept. Application of this new structured approach allows various module designs that are compatible in layout and mechanical installation. CONEC manufactured the power connectors for the ATCA System which are used in Zone 1.

Mini SAS Connectors

Amphenol's Compact MultiLane Connector is based on industry proven card edge style contacts. This connector system is designed to satisfy the needs for gigabit serial data transmission applications with signal speeds across the connector interface at speeds of up to 10 Gigabits/second on both rows of contacts. The cage is mounted separately to the body so that the stress imposed by insertion and removal of the cable plug does not affect the signal/body solder joints. Complies to SFF-8086, SFF-8087, and SFF-8088 **Specifications: • Cage:** Zinc diecast with nickel plating **• Contacts:** Phosphor bronze with 30µ gold plating.

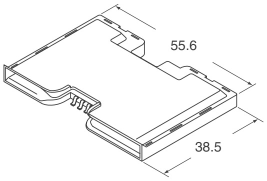
MK I: MK I connectors have fixed contacts and a blade card detection switch unsealed. These connectors are intended for applications where the card usage is relatively low and the environment is benign.

MK II: EMV™ Compatible. MK II connectors with fixed contacts have been developed for applications where a landing contact mechanism is not required but performance and reliability are still key considerations.

MK III: EMV Compatible. MK III connectors are intended for applications such as pay TV, home shopping and utility meters. Mainly driven by the Set Top Box market for payment and /or deciphering.

CCM02 - Fig. 3



MK I: MK I is a connector with landing contacts. The contacts do not touch the card until it is almost fully inserted and a minimal wiping action removes any non-conductive material. Designed to give a positive feel as the card is fully inserted. Features: 100,000 card insertion cycles.

MK II: EMV Compatible. MK II connectors with landing contacts are dedicated for applications where the reader usage is high and the life span of the card is a key consideration. It has been redesigned to give an even higher performance in a compact, affordable package. Features: 500,000 card insertion cycles.

MK II:

Developed to interface with SIM/SAM cards as defined by GSM11-11 and ENV1375-1. Available with either hinged covers or fixed covers and have been designed to minimize the amount of space needed for PCB mounting. The high temperature thermoplastic moldings are suited for infrared and convection soldering processes.

MK III:

SIM/SAM card connector features an integrated card detection switch providing a competitive advantage to smart card reader device manufacturers by minimizing the space usage on the PCB, features a side entry to offer convenient card access without opening the device. The unique design makes it ideal for telecommunications, portable electronics, POS terminals and similar applications, and meets GSM11-11 specifications.

MK II: Connectors are without card guidance and used where space is at a premium and the card guidance can be built around the connector (rather than provided by the connector itself).

MK III: EMV Compatible. Designed to interface with either full or SIM/SAM smart cards and designed to minimize space usage on the PCB.

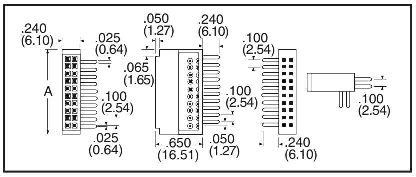
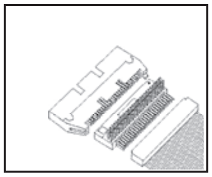
3M Intra-Connector™





The Intra-Connector mates in-line with standard double row socket connectors. It has one set of female contacts, but two sets of male contacts at right angles. It provides instant line-by-line "probe-ability." The pins can also be used to make daisy chaining possible from a single connector cable end. Modified configurations are quickly available for special connections. The Intra-Connector system provides both straight-in and right angle functions. It mates with a standard .10" x .10" (2.54mm x 2.54mm) dual row connector or PC board-mounted .025" (.64mm) square pins. Two Intra-Connector systems used with the Intra-Switch™ system form a complete test assembly for probing signals under no load and full-load conditions.

Contacts are non-corrosive Alloy 770; body is glass-filled polyester thermoplastic.

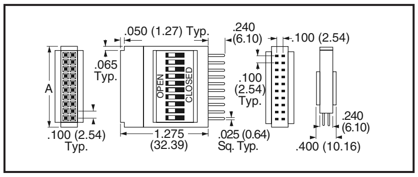
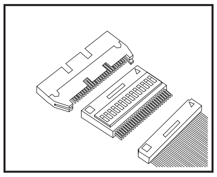
3M Intra-Switch™





The low profile design and recessed switch buttons allow room for working in confined areas. Using a pencil or probe tip, any or all switches may be actuated.

Applications include switching command signals to or from test equipment and programming optional preset logic functions. Switch buttons are recessed to prevent accidental switching. "Open" and "closed" positions are clearly marked, molded-in the body.

Contacts are non-corrosive Alloy 770; body is glass-filled polyester thermoplastic.

Intra-Switch is compatible with most sockets and mating headers for flat cable, including 3M, T&B/Ansley, Berg, Amp, Symbex and many others.

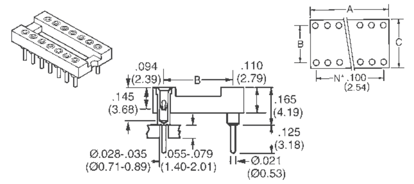
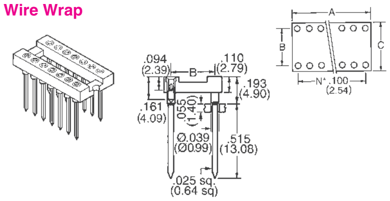
MILL-MAX Dual-In-Line Sockets – Open Frame (Screw Machined)

Solder Tail



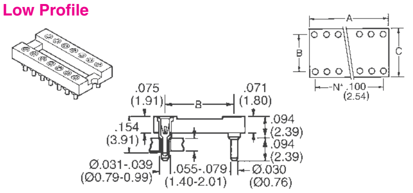
Most popular line of standard low profile IC-Sockets. Open frame design leaves space beneath IC for improved heat dissipation, easier PCB cleaning and inspection. **Insertion Characteristics:** 4-finger standard

Wire Wrap



Solderless wire wrap terminals are firmly locked in the insulator body to withstand torque of wrapping tool. Length of terminal for three-level wrapping. **Insertion Characteristics:** 4-finger standard

Low Profile



"Ultra low profile" Dual-in-line sockets are equipped with specially designed contacts allowing .095" (2.41mm) height above PCB. Special short contact requires .075" (1.91mm) insertion depth only. Solder tail diameter .030" (.76mm). **Insertion Characteristics:** 4-finger short contact

IC Sockets

With Integral Decoupling Capacitor Machine Screw Contact

Special Features/Applications:
• To eliminate noise at the source before it can reach the chip • Advantages for uses such as high speed logic and memory applications • To eliminate long leads as potential sources of noise because capacitor leads are connected directly to the ground and voltage pin of the socket • To save minimum of 12% on board space

Technical Data: • Insulator body material: glass filled polyester UL94V-0 • Pin: screw machined Socket with integral glass encapsulated ceramic capacitor 0.1µF, 50VDC

Single In-Line Sockets — Solderless Press Fit, Compliant Tail

Features:
Unique compliant tail pins conforms to .040" ±.003" (1.02mm ±08mm) finished hole diameter without stressing inner layers.

Application of Compliant Tail Pins:
Mill-Max's patented (Patent No. 4,799,904) compliant tail features precision machined pins that are hollow and slotted to conform to a .040" ±.003" (1.02mm ±08mm) diameter PTH. As the pin is inserted, the slot compresses to fit the PTH, thus avoiding damage (see illustration). The pin's tail has fine serrations that form a perfect "gas tight" connection that doesn't require soldering, and since the pin doesn't damage the hole, compliant tail sockets and connectors can be easily replaced.

Quad Flat Pack (QFP) to PGA Adapters

Features:

- Adapters convert surface mount type (SMD) Quad Flat Pack (QFP) packages to standard pin grid array through-hole packages on .100" (2.54mm) pin spacing. This allows SMD QFP packages to be used in standard PGA and PGA ZIF sockets, which is extremely useful for testing.
- SMD QFP packages are typically less expensive and often more readily available than their through-hole PGA counterparts.
- Users do not have to redesign through-hole boards in order to utilize the advantages of the SMD QFP packages.

Equipment

1LA: Together with a time signal generator (TSG400, TSG800), the 1-loop-antenna creates a defined field strength in an area of 5-10 meters and provides the time signal DCF, WWVB, MSF or JJY. **DAT100:** The DAT100 is used with the TSG400/800 for direct connection between time signal generator and the customized application. The DAT100 provides a reduced and leveled input for the application. **TSG800:** **Applications:** • Simulation of time signals DCF, MSF, WWVB, HBG and JJY • Creation of exact defined time signals for measuring purposes • Support of software development for RC watches and clocks • Creation of highly exact frequencies • Production test mode **Features:** • Mains operated equipment with 50Ω output for time signal **GPS100:** The GPS100 is a GPS receiver, used in connection with the TSG-series of time signal generators. GPS100 will receive the UTC time signal anywhere in the world and calculate it into the selected protocol • Exact time information, independent of location of production/development place • Calculation of UTC time into selected protocol time **Benefits:** • No outages due to reception difficulties in production location • Exact synchronization of RC time - avoiding time deviations when transporting time pieces to another country • Support of the internal AGC function of RC time pieces

Universal Time Code (UTC) Receivers and Demo Boards

CME8000-BUS: The CME8000 is a BiCMOS integrated straight through receiver with very high sensitivity and a pre-decoding of the time signal transmitted from WWVB, DCF77, JJY40, JJY60, MSF and HBG. The receiver is prepared for multi-frequency and country reception by using an integrated logic. It is connected to an on-board micro-controller in the CME-BUS which is programmed with a pre-defined serial interface protocol. The module can then act as a tap into a inter-processor serial communications bus, and is able to communicate between two or more boards, micro controllers or other devices distributed among one or more platforms. From this module, any host can always obtain absolute proofed time information.

Features: • Automatic reception of long wave time signals world wide • Manual or automatic selection of radio control signal possible • Forced reception mode • Real time clock • Real signal quality indicator during reception • 24-hour system • Host-controllable reception settings (including time and duration of reception) • Low power consumption (< 2mA during reception active mode) • Very high long wave reception sensitivity (0.4μV) • Built in decoding for different signals • Automatic switch between dual band signals • User settable reception mode by host software control command • Wide operating range: 2.7 ~ 5.0V

CME8000-DB: **General Description:** • Local time in hours/minutes/seconds plus Time Zone Indicator • Alarm • Date Alert • Time zone display in three different ways • Stop watch functions in three different ways • Low battery indicator • Backlight

CME8000/CME6005: It is the world's first mixed signal Bi-CMOS integrated straight through receiver with very high sensitivity and a pre-decoding of the time signal transmitted from WWVB, DCF, JJY, MSF and HBG. The receiver is prepared for multi-country reception by incorporating integrated logic, integrated functions such as stand-by mode, integrated antenna switching (CME8000), integrated crystal switching (CME8000) and hold mode function features for universal RC applications. The power down mode increases the battery lifetime significantly to make this device suitable for all kinds of radio-controlled time pieces.

CME8000-EK: Evaluation kit includes: • TSG200 • CME8000-BUS module • 5 pieces of CME8000 samples • 6 pieces of crystal samples (two each: 40kHz, 60kHz, 77.5kHz) • 3 pieces of antenna samples (one each: 40kHz, 60kHz, 77.5kHz)

CMMR-6: The ferrite antenna and the receiver module with CME6005 form a complete receiver unit for single and dual band time signal reception. **Signal Out:** Analog **Features:** • Small size • Ready-to-use receiver module for design and development work

ID ISC.LRM2000-A, ID ISC.LRM2000-B and ID ISC.LR2000-A

The ID ISC.LR2000 Long Range Reader and the ID ISC.LRM2000 Long Range Reader Unit are the top of the line Long Range Reader versions of the OBID i-*scan* HF product line.

The ID ISC.LR2000 and ID ISC.LRM2000 are the most powerful reader in the OBID i-*scan* HF product line. Both devices have identical RF performance. The ID ISC.LRM2000 differs from the ID ISC.LR2000 in terms of housing, interface options and functionality for the host connectivity of the device.

Features:

• Highly sensitivity receiver increased the tag detection range so that the most transponders can be read over the entire power up, field strength area. • RF front end accommodates arbitrary cable lengths between the reader and the antenna without adversely affecting the read range of the antenna. • RF front end has its own power control to protect the read range from external noise sources. • The reader delivers a DC voltage on the antenna output to source DC powered devices connected to the antenna cable, such as the OBID i-scan Dynamic Antenna Tuning board (ID ISC.ANT.DAT-A). • RF source of the reader meets different national radio rules and can achieve the 60dbμA/m ETSI limits.

The reader is able to directly control antenna multiplexing functions. The RF section of the reader is controlled by a dedicated DSP based, RF controller. A second microcontroller, the Application and Connectivity Controller (ACC), uses an ARM processor running a μcLinux operating system. The reader has four hardware interface ports: Ethernet, RS232, RS485, and a Compact Flash 2 compatible port to support a WLAN Card. All ports are under control of the ACC. In combination, the powerful and flexible RF transmitter and receiver and intelligent digital controller form the basis of an agile, multi protocol reader that can be updated as future protocols and features are created.

ID ISC.DAT-A

With the help of these tuning boards, you can realize your own individual antenna arrays, combined with our i-*scan* Long Range readers. The dynamic antenna tuner ID ISC.DAT-A is designed for automatic calibrating and tuning of RFID antennas with an operating frequency of 13.56MHz. The parameters for setting the antenna are measured on the board under operating conditions. The antenna tuner is also able to disconnect the antenna circuit through an electronic switch up to a certain power. The ID ISC.DAT is driven over the HF line. The antenna tuner thus functions as a so-called function unit. Measured parameters or the calibration status can be sent to the host over the HF line. Dynamic Antenna Tuning Board.

Antennas are a critical and often neglected factor in determining the range and reliability of any wireless link. Antenna Factor antennas are ideal for achieving maximum performance and cost efficiency from most discrete or modular designs. All antennas are designed to meet FCC and international standards.

PW Series: Designed for permanent attachment, the PW series of 1/4 wave whip antenna is designed to offer outstanding performance in a rugged, cost effective Part 15 compliant package. The antenna is attached by securing its base through a 1/4" hole in the product's package. The antenna is fed through the base via RG-174 (7" standard length) coax which may be soldered directly to a PCB or attached via a connector.

PML Series: Designed for permanent attachment, PML Series 1/2 wave whips give outstanding performance in a rugged and cost effective package. An internal, center-fed element eliminates the need for a ground plane. Can be attached by securing it with a nut or by threading it into a PEM style insert. The antenna is fed through the base with RG-174 coax cable. Standard cable length is 8.5".

RH Series - Reduced Height: Significantly smaller than our larger whips, the RH series is ideally suited for products where cosmetic or functional requirements dictate a compact, aesthetically pleasing antenna.

CW Series: The CW series antennas feature an FCC Part 15 compliant Reverse Polarity SMA connector allowing for easy field replacement. These antennas deliver outstanding performance in a rugged and cosmetically attractive package.

HD Series - Reduced Height: This reduced height 1/4 wave antenna is ready for years of abuse thanks to a highly flexible internal helical which is over molded with a heavy duty protective jacket. The HD series is an excellent choice for outdoor application or for use in adverse environments where the antenna must resist shock, harsh weather and tampering.

RCS Series - Ultra-Compact Right Angle: The RCS series is ideally suited for products requiring an attractive yet compact antenna in a right-angle form factor.

RCL Series - Compact Right Angle: Similar to the RCS series but in a larger form factor. It is useful in products where additional height above the product's case is needed or a slightly wider operational bandwidth is desired. The 2.4GHz version has a center-fed 1/2 wave element with internal ground reference.

RCT Series: The RCT 1/2 wave 2.4GHz antenna delivers outstanding performance and maximum orientation flexibility in a compact physical package. The antennas innovative articulating base allows the antenna to tilt and swivel for optimum orientation by the product's end user. The antenna mounts quickly via an RP-SMA connector.

LP Series: LP series antennas are low-cost, reduced height, permanently attached 1/4 wave whips. They are ideal for applications requiring a rugged, cosmetically attractive, yet cost-effective antenna solution. The antennas are easily secured directly to a user's PCB via a single screw.

RA Series: The RA series offers maximum mounting and orientation flexibility in a cost-effective reduced height package. The antennas innovative base allows a wide range of horizontal and vertical motions which enhances versatility for both the designer and the customer. The antenna mounts quickly to a PCB via a single screw and meets all Part 15 Requirements.

RAF Series: A compact, dual-band antenna covering 2.45 and 5.8GHz bands, featuring a tilt and swivel joint and attaches using a SMA or Part 15 compliant RP-SMA connector.

SP Series - The "Splatch": The Splatch uses a grounded line technique to extract outstanding performance from a tiny SMT element. Unlike many compact antennas the Splatch is highly immune to proximity effects making it an ideal choice for hand-held applications for remote controls, pagers and alert devices. This unique antenna is designed for hand or reflow mounting directly to a product's circuit board.

JJB Series: The JJB Series packs near the performance of a conventional monopole into an incredibly compact 7mm diameter package. These antennas are ideal for any OEM application requiring a compact, cosmetically attractive, low cost antenna solution. The antenna features a through hole feed line which attaches directly to a user's PCB. Internal or external mounting is possible.

CHP Series: One of the world's smallest, high performance 2.4GHz. Chip Antennas. Ideal for all 2.4GHz applications including Bluetooth, 802.11, home RF, ZigBee and other popular and emerging standards. Uses an advanced multilayer LTCC Technology and a proprietary hybrid spiral element to achieve size and performance characteristics superior to other designs. Fully compatible with hand and reflow attachment processes.

HE Series - Helical: Designed for direct PCB mounting. HE's compact size makes them ideal for internal concealment inside a product's housing. The wire diameter and coil spacing are optimized for wider than typical bandwidth.

RAH Series: Ideal for products requiring an ultra compact antenna in a right-angle form factor. This series is omni-directional, has a flexible main shaft and is fully weatherized.

HW Series: Low cost, outstanding VSWR antennas. These have an internal counter-poise.

HWR Series: These 1/4-wave monopole antennas deliver an outstanding performance. The articulating base allows the antenna to tilt 90 degrees and rotate 360 degrees. HWR Series antennas attach via a standard SMA or Part 15 compliant RP-SMA connector.

CHP Kit: Allows for rapid evaluation of Antenna Factor's tiny ANT-2.45-CHP antenna. As one of the smallest and most efficient chip antennas in the world it is ideal for all 2.4GHz applications including 802.11, Bluetooth, ZigBee and Home RF. Includes a reference jig which allows for immediate assessment of the antennas performance and five additional antenna samples for use in a customer's design.

Surface Mount Antennas

MHW Series:
This antenna style provides a clever solution to the unique needs of difficult environments such as a vehicle. Designed to mount directly onto nonconductive interior surfaces such as wallboard, windows or a rear view mirror, these compact antennas are easily concealed, minimizing potential theft.

HDP Series:
A compact, center-fed antenna that achieves efficient operation at either or both of two frequency bands. Its durable, unobtrusive housing attaches permanently with integral adhesive to flat, nonconductive surfaces.

VDP Series:
Similar to the HDP Series but the cable enters from the bottom to facilitate vertical orientation. Also, this compact, center-fed antenna achieves efficient operation at any or all of three frequency bands. Attaches permanently with integral adhesive to flat nonconductive surfaces.

Micro-Module Bluetooth®

A highly integrated Bluetooth 1.2 compliant solution. The integrated baseband controller and 2.4 GHz radio combine to form a complete, small form-factor (6.1mm x 9.1mm x 1.2mm) Bluetooth node.

The baseboard controller has a standard Host Controller Interface (HCI).

The firmware supplied in the on-chip ROM supports a complete Bluetooth Link Manager and HCI with communication through a UART or USB interface. This firmware features point-to-point and point-to-multipoint link management, supporting data rates up to 723kbps.

The radio has a heterodyne receiver architecture with a low intermediate frequency (IF), which enables the IF filters to be integrated on-chip. The transmitter uses direct IQ-modulation with Gaussian-filtered bit-stream data, a voltage controlled oscillator (VCO) buffer, and a power amplifier.

LMX5453 Bluetooth 2.0 compliant solution. **Features:** • eSCO • eSCO over USB HCI transport

OMRON® NEW! RFID Product

RFID stands for Radio Frequency Identification. In contrast to bar codes, RFID uses radio waves to send information such as a unique ID of a product to an antenna, which is then read by the reader. This ID or programmed information is displayed on a host, such as your computer. With RFID you can find all of your goods more effectively without having to see them directly or unpacking boxes/pallets. Furthermore, multiple ID tags/Inlays can be read while being moved in a warehouse or plant.

GPS Evaluation Kit

Provides a hardware and software evaluation platform for development of the RF Solutions GPS/PVT module. This module provides position, velocity and time information in a standard NMEA string format that is compatible with a range of GPS driven navigation packages including Microsoft AUTOROUTE. The evaluation board provides a completed design utilizing the GPS Module. This provides a direct PC interface via 9 way D type connector and a row of pin headers to enable configuration and monitoring of the GPS signals. Power may be from any DC supply from 3.3~15V. Two LEDs provide additional information relating to the signal lock and validity of the onboard almanac.

Features: • Standard RS232 Data Output Via 9-Way D Type Connector • Data In Standard NMEA Format • Supplied with GPS Antenna, Supporting Software, RS232 Cable (for PC Connection) • LED Indicators for Valid Almanac and Signal Lock • Link Selectable and Programmable Baud Rates • Onboard Regulator Allows 3.3 ~ 15V Supply • Compatible with Popular Routing Software

RF Encoder/Decoder Chipset

The RF Solutions RF600E and RF600D are easy to use encoder and decoder ICs. They have been designed to achieve the maximum possible range from any radio/InfraRed transmitter/receiver set. Unlike other encoder/decoder devices, the RF600E/600D provide an unprecedented level of security which prevents copying or grabbing while also obtaining optimum range from the transmitter and receiver.

Features: Highly secure KEELOQ® protocol • Simple to use • Stand Alone operation • Achieves maximum range from RF modules • Decoder serial output • LED indication of transmission • Directly compatible with KEELOQ® decoder • Easy learn feature of transmitters

Hand Held RF Meter

A miniature RF meter which can be used to show the presence of a radio signal. Briefly press the power switch and the LED bargraph shows RF activity within the local environment. The peak signal is held for 1 second. This can be invaluable when installing a radio system to determine if other RF signals are present (interference) and also validate the signal strength of the radio transmitter to be installed.

RFID Evaluation Kit

The DEMOKITCRX14 tools are designed to demonstrate the STMicroelectronics short range product range that includes the SR176, SRIX512 and SRIX4K products.

The SR176 / SRIX512 / SRIX4K is contactless memory, powered by a transmitted carrier radio wave at 13.56MHz. It contains a 176-bit (SR176), 512-bit (SRIX512) or 4096-bit (SRIX4K) EEPROM, with memory mapping organized as blocks of 16 or 32 bits. It conforms to the ISO 14443-B recommendation for the transfer of power and signals via radio transmission. The DEMOKITCRX14 reader circuitry amplitude modulates (10% modulation) the data on the carrier using amplitude shift keying (ASK). The SR176 / SRIX512 / SRIX4K replies by load modulating the data on the carrier using the BPSK (Bit Phase Shift Keying) coding using the 847kHz sub-carrier. The data transfer rate in each direction is 106 Kbit/ second.

The purpose of the DEMOKITCRX14 program is to give an example of how the interfacing can be achieved. It does not allow the user to evaluate all of the different ISO 14443 modes.

The DEMOKITCRX14 gives access to the full memory mapping. It is possible to read and write into the selected SR176 / SRIX512 / SRIX4K. This release of demonstration software, differentiated for each SR176 / SRIX512 / SRIX4K, allows all of the product features to be exercised.

Kit Includes: • One CD-ROM • One CRX14 board with I^2C connector • One USB Transceiver with USB cable • Some SR176 and SRIX4K Samples • Documentation

NEW! CR14 and CRX14 Coupler Chips

The CR14 and CR14X series are contactless couplers that are compliant with the short range ISO14443 type-B standard. They are controlled using the two wire I^2C bus. They generate a 13.56MHz signal on an external antenna. Transmitted data is modulated using Amplitude Shift Keying (ASK). Received data is demodulated from the PICC (Proximity Integrated Coupling Card) load variation signal, induced on the antenna, using Bit Phase Shift Keying (BPSK) of a 847kHz sub-carrier. The Transmitted ASK wave is 10% modulated. The data transfer rate between the CR14/CRX14 and PICC is 106Kbit/s in both transmission and reception modes.

NEW! Bluetooth® Modules

GS-BT2416xx is the new series of Bluetooth core embedded modules intended for audio Hi-Fi and Industrial applications based on the STLC2416 baseband controller with 4Mbit flash and the STLC2150 radio transceiver. The series supports protocol layers up to HCI and it represents a cost effective packaged solution for customers in need of a simple wireless link. The Bluetooth approach is facilitated by the Serial Port Profile (SPP) firmware embedded in GS-BT2416CX.AT1. This ready-to-go solution is simply managed by AT commands. The modules are also available in Class 1 and Class 2 for either long range or low power operation with data transfer up to 720Kbps Bluetooth v1.2 compliant.

Features: • Class 1 (long) and Class 2 ranges • Bluetooth v1.2 compliant • Embedded SPP profile for cable replacement • AT commands set • HCI interface over UART and USB • Single 3.3V voltage supply with embedded voltage regulator

NEW! ZigBee™

STMicroelectronics has joined forces with Ember Corporation to produce mutually-compatible, complete ZigBee-compliant solutions-comprised of semiconductors, software and tools.

ST has invested in ZigBee as the leading wireless control and sensoring network solution. ZigBee stands apart from other RF solutions as it is the only wireless standards-based technology that: • Addresses the unique needs of remote monitoring and control, and sensory network applications • Enables broad-based deployment of wireless mesh networks with low-cost, low-power solutions • Provides the ability to run for years on inexpensive primary batteries for a typical monitoring application

ST's ZigBee solutions offer two main advantages: • All of our solutions are 100% compatible with Ember's products, offering clients the flexibility of 2 supplier sources • All products are pre-loaded with the Ember ZNet stack, the networking software developed by our strategic partner Ember

HF Manual Antenna Tuner Board

The tuning board is a manually adjustable matching circuit for constructing custom antennas having a transmission frequency of 13.56MHz and an input impedance of 50Ω. Together with an antenna conductor (e.g., the shield of an RF213 cable) it is quite easy to construct antennas of various sizes and shapes.

The antennas are tuned using jumpers and trim capacitors after installing the antenna conductor. After this is done the antenna must be continuously matched to its surrounding conditions. If after tuning the antenna is moved to a different position under different ambient conditions, it may have to be recalibrated.

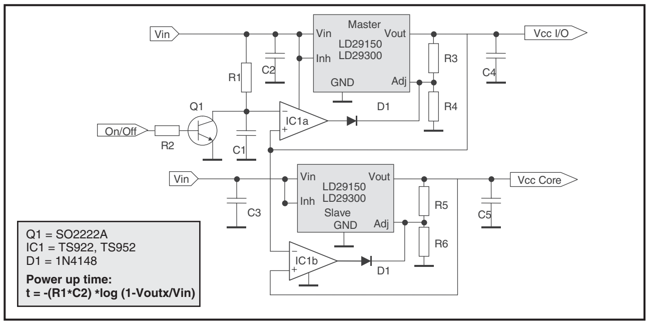
Xilinx FPGA Power Management Systems

Xilinx power supply requirements for the core, I/O, and auxiliary power supplies include voltage outputs ranging from 1.2V to 5V and current outputs from tens of milliamps to multiple amperes. Depending on the system requirements, a linear or a switching regulator may be used to supply power to the FPGA.

STMicroelectronics makes both linear and switching regulators with a wide variety of output voltages and output current levels.
When power sequencing is needed, the following circuit will control the power-up and power-down sequence of the Vcc_{core} and the V_{cco} supply voltages.

Linear regulators are the best choice when board space is at a premium, low output noise is important or a fast response to inputs and transients is required. Linear regulators provide low to medium output currents (up to 3A) with a simple design approach.



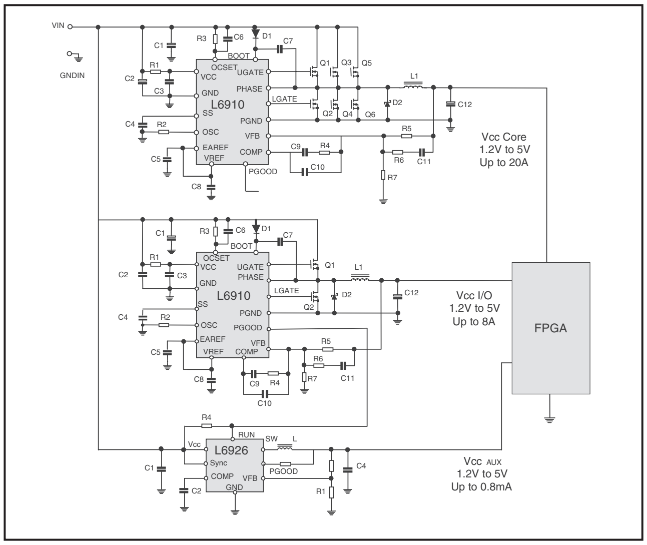
Linear Solution

The above solution implements a controlled slew rate on power up and power sequencing for the core and I/O voltages. Both outputs rise and fall with the same slew rate, set by R1 and C1. t=-(R1*C2) *Log (1 - Vccx/Vin)

Note: Vout Master must be higher than Vout Slave

Switching regulators are best used when design efficiency is critical and/or large output currents are required (such as Spartan-3™ and Virtex-II™). Switching supplies are known for excellent efficiency, but the output is more susceptible to noise due to the switching nature of the regulator.

Switching regulators require inductors and input and output capacitors for DC-DC conversion.



Switching Solution

The above solution provides a Core voltage range from 1.2V to 5V with a current up to 20A, an I/O voltage from 1.2V to 5V with a current capability up to 10A, and an auxiliary supply voltage from 1.2V to 5V up to 800mA.

XILINX® In-System Programmable CPLDs (Complex Programmable Logic Devices)

The **XC9500 CPLD** family provides advanced in-system programming and test capabilities. All devices have a minimum of 10,000 program/erase cycles. Extensive IEEE 1149.1 (JTAG) boundary-scan support is also included on all family members. The XC9500 family is fully pin-compatible allowing easy design migration. Advanced system features include output slew rate control and user programmable ground pins to help reduce system noise. I/Os may be configured for 3.3V or 5V operation. All outputs provide 24mA drive.

The **FastFLASH XC9500XL** family is a 3.3V CPLD family targeted for high-performance, low-voltage applications. The XC9500XL architectural features address the requirements of in-system programmability. Each user pin is compatible with 5V, 3.3V, and 2.5V inputs, and the outputs may be configured for 3.3V or 2.5V operation. The XC9500XL device exhibits symmetric full 3.3V output voltage swing.

The **CoolRunner™-II** device is a 3.3V CPLD targeted at power sensitive designs that require leading edge programmable logic solutions. CoolRunner CPLDs offer a TotalCMOS™ solution, both in process technology and design technique. Xilinx employs a cascade of CMOS gates to implement its sum of products instead of the traditional sense amp approach.

FPGA (Field Programmable Gate Arrays)

A Technical Overview:

Every Xilinx FPGA performs the function of a custom LSI circuit, like a gate array, but the Xilinx device is user-programmable and even reprogrammable in the system.

Xilinx sells standard off-the-shelf devices in many different sizes, speeds, operating temperature ranges and packages.

The user selects the appropriate Xilinx device and then converts the design idea or schematic into a configuration data file, using the Xilinx development system software, and loads this file into the Xilinx FPGA.

NEW! CPLDs

Altera's Max families include the cost-optimized MAX 3000 and the high-performance MAX 7000 CPLD's, each of which offers densities, packages and speed grades to meet a variety of design needs. Altera's MAX CPLD's are non-volatile, single-chip solutions that do not require additional configuration devices. This means that they can be pre-programmed and reprogrammed using in-system programmability (ISP) and will retain the programming algorithm securely, even when the device is powered off.

Configuration Devices

During device operation, Altera® FPGA's store configuration data in SRAM cells. Because SRAM memory is volatile, the SRAM cells must be loaded with configuration data each time the device powers up. You can configure the devices using data stored in an Altera configuration device. Altera configuration devices are offered in different densities and provide a variety of features.

CPLDs (Complex Programmable Logic Devices)

Atmel offers a broad range of high-density, low-power, and cost-effective solutions enabling designers to create products that are "just what the market ordered." Based on a standard architecture, which uses industry standard development tools, Atmel's CPLDs offer the unique low-power or "L" feature while providing 100% connectivity. These devices are processed with Atmel's proprietary 0.65-micron processes and have a EEPROM memory.
The ATF750/C CPLDs are based on a 22V10-type architecture and provide market-leading capacity and flexibility in a 22V10 footprint with twice the registers and additional features for better logic utilization.

The ATF1500 Series is targeted at wider logic density, with higher number of I/O's. This family has devices from 44 to 160 pins, and 32 to 96 I/O's. High connectivity, and flexible architecture make these parts highly suitable for system design. In system programmability in the larger devices allow for reconfiguration even after the device is in the system.

Standard Development Tools:
Atmel's philosophy is that designers should be able to use known development tools. Third-party design tools such as Synario™, ABEL™, CUPL™, PPLDesigner-XL™, LOG/iC™, and PLDSyn™ support Atmel's EPLDs. Also Atmel-specific versions of the popular Synario, ABEL, and CUPL design tools are offered. In addition, workstation support is available on popular platforms with Viewlogic, MINC, Cadence, Mentor, and Synopsys.

FPGA's (Field Programmable Gate Arrays)

AT40K Series FPGAs

Atmel's AT40K Series coprocessor FPGAs range from 5K to 50K usable gates, and are designed for high density, compute-intensive DSP and other fast logic designs. The AT40K family sol ves the Logic vs. SRAM trade-off problem by providing fast, flexible, distributed 10ns FreeRAM™ without using valuable logic resources. Structured logic functions, including variable array multipliers can be implemented directly in core cells without using any bussing resources - providing dramatic improvements in speed, utilization, power and system cost.

The AT40K family has the ability to implement Cache Logic design, where part of the FPGA can be reprogrammed without loss of register data, while the remainder of the FPGA continues to operate without disruption. This is ideal for building adaptive filters, variable coefficient multipliers and other designs where the datapath can change to increase system performance.

All Atmel FPGAs can be designed using industry standard CAE tools for schematics, VHDL and Verilog on a PC, Sun, or HP workstation. Software tools are available on Atmel's website at: http://www.atmel.com/fpga_software.html

Features:

- Distributed, single/dual port 10ns SRAM, independent of logic cells
- Up to 384 PCI compliant I/Os
- Mixed 3V/5V capability
- Architecture optimized for efficient, ultrafast array multipliers
- Cache Logic® dynamic full/partial reconfigurability in-system
- Eight global clocks
- Efficient, industry-standard design tools, optimized for synthesis
- QuickChange™ tools for adaptive hardware designs
- Variety of surface mount packages
- All devices in family are pin-compatible

AVR® 8-Bit RISC Microcontrollers

Atmel's AVR microcontrollers have a RISC core running single cycle instructions and a well-defined I/O structure that limits the need for external components. Internal oscillators, timers, UART, SPI, pull-up resistors, pulse width modulation, ADC, analog comparator and watch dog timers are some of the features you will find in AVR devices. AVR instructions are tuned to decrease the size of the program whether the code is written in C or Assembly. With on-chip in-system programmable Flash and EEPROM, the AVR is a perfect choice in order to optimize cost and get product to the market quickly.

The AVR is a low-power CMOS 8-bit series of microcontrollers based on the AVR RISC architecture. By executing powerful instructions in a single clock cycle, they achieve throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed. The AVR core combines a rich instruction set with the 32 general purpose working registers. All 32 registers are directly connected to the Arithmetic Logic Unit, allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

General Features:

• Utilizes the AVR high-performance and low-power RISC architecture • 32 x 8 general purpose working registers • Programming lock for Flash program and EEPROM data security • Low-power idle and power down modes • External and internal interrupt sources • Low-power, high speed CMOS process technology • Fully static operation

USB to UART Bridge

The CP210x is a single-chip USB to UART bridge that converts data traffic between USB and UART formats. The chip includes a complete USB 2.0 full-speed function controller, bridge control logic and a UART interface with transmit/receive buffers and modem handshake signals.

The device also features on-board EEPROM, a voltage regulator, a USB transceiver and an integrated internal oscillator, eliminating external components generally required in USB applications. System development is further simplified by the CP210xEK evaluation kit, which includes a complete USB to RS-232 evaluation board and royalty-free device drivers for PC and Macintosh platforms.

Ethernet Controllers

The CP220x is a single-chip Ethernet controller containing an integrated IEEE 802.3-compliant Media Access Controller (MAC), a 10 Base-T Physical Layer (PHY), and 8 kB of non-volatile Flash memory available in either a 28-pin QFN (5 x 5mm), or 48-pin TQFP (9 x 9mm) package.
The on-chip Flash memory may be used to store user constants, web server content, or can be used as general purpose nonvolatile memory. The Flash is factory pre-programmed with a unique 48-bit MAC address stored in the last six memory locations. Having the unique MAC address stored in the CP220x often removes the necessary serialization step from the product manufacturing process of most embedded systems.

ProSLIC®

Subscriber line interface circuit (SLIC), codec and battery generation functionality. Combined with Silicon Laboratories' Si3201 linefeed integrated circuit, the Si3210 packs maximum performance and flexibility into a 1.5 inch^2 footprint, making it the smallest single-channel telephony interface available. The integrated battery supply continuously adapts its output voltage to minimize power and enables the entire solution to be powered from a single 3.3V or 5V supply. Software configurable features include 5 REN internal ringing up to 90 VPK, DTMF generation and decoding and a comprehensive set of telephony signaling capabilities for global operation with only one hardware solution. The Si3230 provides the same performance of the Si3201 without the integrated codec.

Power over Ethernet

The Si3400 integrates an IEEE 802.3af compliant interface and complete power management solution for a Power over Ethernet (PoE) powered device (PD) application. The Si3400 converts the high voltage supplied over a 10/100/1000BASE-T Ethernet cable into a regulated low voltage output supply. For applications that require more power than the 11W (max) capability of the Si3400, the Si3401 provides the same feature set as the Si3400 but adds an increased hot swap switch current limit of 470mA (min.), versus the Si3400's 350mA (min.). The Si3401's higher current limit enables it to support applications in the range of 14 to 16W.

Single-Chip Voice Record/Playback Devices

General Description:
Winbond's patented ChipCorder® technology is a revolutionary multilevel technique to record and play back sound on a single-chip. The advanced technology provides natural sound reproduction, in a cost-effective device that retains stored messages in the event of power loss or battery replacement. The technology, based on a unique multilevel storage approach, stores multiple voltage levels into previously binary, two level EEPROM memory cells. Unlike traditional voice solutions whereby voice is digitized, the Winbond approach stores analog signals directly into single cells as one of over 250 levels. All ChipCorder products integrate the oscillator, microphone pre-amplifier, automatic gain control, anti-aliasing filter, smoothing filter, and speaker amplifier on-chip to achieve a complete "system on a chip." Only a microphone, speaker, power source, and a few passive components are needed to implement a complete record/playback function.

ISD1400 Series: Description: The ISD1400 expands on the simple pushbutton interface of the ISD1200, with longer storage durations of 16 and 20 seconds. It offers full addressability to handle multiple messages on a single-chip and is widely used in communication and consumer applications. **Features:** • 5 volt operating range • Automatic power-down • Fully addressable to handle multiple messages

ISD1600B Series: Description: The ISD1600B Series ChipCorder is a single-message, single-chip, record/playback solution with selectable durations from 6.6 to 40 seconds. With the ISD1600B device a minimum record/playback subsystem can be configured with a microphone, a speaker or buzzer, several passive components, two push buttons, and a power source. **Features:** 2.4 ~ 5.5 operating voltage. Sample frequency 4KHz ~ 12KHz controlled by external resistor

ISD2500 Series: Description: The ISD2500 family offers improvement in speech length up to a maximum of 90 seconds. This extends the single-chip voice solution to industrial and high-end consumer applications. This family offers sound capability for new applications such as cellular phones, answering machines, voice-response faxes, copy machines and industrial applications where voice prompting provides product differentiation for equipment and manufacturers. **Features:** • 5 volt operating range • Fully addressable to handle multiple messages • Directly cascadable for longer durations • Automatic power-down (push-button mode)

ISD400X Series: Description: The ISD4000 series provides high-quality, 3 volt, single-chip record/playback solutions for 2 to 4 minutes (ISD4002), 4 to 8 minutes (ISD4003), and 8 to 16 minutes (ISD4004) messaging applications. These CMOS-based devices include an on-chip oscillator, anti-aliasing filter, smoothing filter, AutoMute™ feature, audio amplifier, and high density, multilevel Flash storage array. **Features:** • Single +3 volt supply • Low-power consumption • AutoMute feature to provide background noise attenuation • Fully addressable to handle multiple messages • On-chip clock source • Microcontroller SPI or Microwire™ Serial Interface

ISD5008 Series: Description: The ISD5008 device is designed for use in a microprocessor- or microcontroller-based system. Address, control, and duration selection are accomplished through a Serial Peripheral Interface (SPI) or Microwire Serial Interface to minimize pin count. Recordings are stored in on-chip nonvolatile memory cells, providing zero-power message storage. Voice and audio signals are stored directly into solid-state memory in their natural, uncompressed form, providing superior quality voice and music reproduction. **Features:** • Fully-integrated solution • Low-power consumption • Single +3 volt supply • Enhanced voice features • Easy-to-use and control • High quality solution

ISD5116 Series: Description: The ISD5116 ChipCorder Product provides high quality, fully integrated, single-chip Record/Playback solutions for 8-16 minute messaging applications that are ideal for use in cellular phones, automotive communications, GPS/navigation systems and other portable products. **Features: Fully-integrated solution:** • Single-chip voice record/playback solution • Low-power consumption supports 2.0V and 3.0V interface logic • Enhanced voice features • Digital memory features up to 4 MB • Easy-to-use and control • High quality voice and music reproduction

ISD1700 Series: Description: The ISD1700 series allows durations of up to 480 seconds (dependant on sample rate). Because of an integrated trigger and SPI interfaces this series can operate in stand-alone or embedded mode. **Features:** 2.4 ~ 5.5 operating voltage. Sample frequency 4KHz ~ 12KHz controlled by external resistor

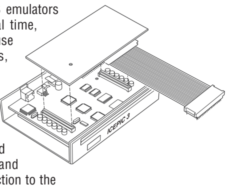
ICEPIC, ICEPIC2 and ICEPIC3 PIC Emulators



ICEPIC, ICEPIC2, and the ICEPIC3 emulators are fully modular, full speed, real time, in-circuit emulator systems, for use with Microchip PIC processors, using interchangeable "personality daughterboards" which connect directly to the users target board and are sold separately.

The ICEPIC3 Emulator is compact, portable, lightweight and offers exceptional performance and value. It uses a quick "hot" connection to the host computer via USB Port, with the system firmware being upgraded at any time from the internet giving total upgrade ability. The ICEPIC3 has additional real-time analysis when using the plug-in trace board which is sold separately. All ICEPIC emulators operate within Microchip's MPLAB 32bit IDE giving the user easy control to perform efficient fast emulation. ICEPIC emulators are supplied as complete systems with power supply, cables, manual and a copy of Microchip's MPASM assembler.

Z86CCP01ZEM Emulator / Programmer for ZiLOG's Z8®
Microcontrollers with up to 32K Program Memory

Digi-Key® Part No. **269-2002-ND**
(See Z8 chart for applicable devices.)

GENERAL DESCRIPTION: ZiLOG's in-circuit emulator/programmer is an interactive, Windows™ based development tool providing a real-time environment for emulation and debugging, which includes a full-featured macro cross assembler to enhance programmer productivity. The Z86CCP01ZEM is a member of ZiLOG's ICEBOX™ product family of in-circuit emulators providing support for the Z8 microcontrollers. The emulator provides essential timing and I/O circuitry to simplify user emulation of the prototype hardware and software product. The Z8 CCP emulator provides users with a hardware platform to develop and debug software in a real-time environment. In contrast, software simulators provide significantly slower operation making them less practical for code development. The Z8 CCP emulator can be connected to a serial port (COM1, COM2, COM3, and COM4) of the host computer and uses ZiLOG Developer Studio (ZDS).

Z8 CCP Emulator Kit Contents: Circuit Board: CMOS Z86C9320VSC, 20MHZ CMOS Z86C5020FSE ICE Chip, 32K x 8 Static RAM (for Code Memory) 18-Pin DIP ZIF Programming Socket, Holes Available for 28/40-Pin ZIF Programming Sockets, Sockets for 28/40-Pin Target Cables, 25-pin RS-232C Interface Connector: 18-Pin DIP Target Cable, Power Cable **Documentation:** Emulator User's Manual

Z8® Series Microcontrollers

Z8 MCU Family

OVERVIEW: ZiLOG MCU products are targeted for cost-sensitive, high-volume applications including consumer, automotive, security, and HVAC. One-time programmable (OTPs) for prototyping as well as volume production where time to market or code flexibility is critical. A variety of packaging options are available. The same on-chip peripherals are used across the MCU product line with the primary differences being the amount of ROM/RAM, number of I/O lines present, and packaging/temperature ranges available. This allows code written for one MCU device to be easily ported to another family member.

FEATURES: • General-Purpose Register (GPR) File Architecture: Every RAM register acts like an accumulator, speeding instruction execution and maximizing coding efficiency. Working register groups allow fast context switching. **• Flexible I/O:** I/O byte, nibble, and/or bit programmable as inputs or outputs. Outputs are software programmable as open-drain or push-pull on a port basis. Inputs are Schmitt-triggered with auto latches to hold unused inputs at a known voltage state. **• Analog Inputs:** Three input pins are software programmable as digital or analog inputs. When in the analog mode, two comparator inputs are provided with a common reference input. **• Timer/Counter (T/C):** The T/C consists of a programmable 6-bit prescaler and 8-bit downcounter, with maskable interrupt upon end-of-count. **• Interrupts:** There are six vectored interrupt sources with software-programmable enable and priority for each of the six sources. **• Watch-Dog Timer (WDT):** An internal WDT circuit is included as a fail-safe mechanism so that if software strays outside the bounds of normal operation, the WDT will timeout and reset the MCU. **• Auto Reset:** All family devices have internal Power-On Reset. **• Low-EMI Operation:** Mode is programmable via software or as a mask option. This new option provides for reduced radiated emission via clock and output drive circuit changes. **• Low-Power:** CMOS with two standby modes; STOP and HALT. **• Full Z8 Instruction Set:** Forty-eight basic instructions, supported by six addressing modes with the ability to operate on bits, nibbles, bytes, and words.

eZ80 - *The Next Generation*

EZ80190AZ050EC AND EZ80190AZ050SC

Just as the Z80 revolutionized the semiconductor industry, the next generation eZ80 is revolutionizing the way that communications are happening today. This elegant system-on-a-chip can serve web pages over a TCP/IP network, allowing easy system monitoring and control, effortless processor code updates, and system compatibility. This solution enables any browser with access to your network the ability to control and monitor a network application. The eZ80 executes Z80 code four times faster than traditional Z80s at the same clock speed, and can operate at speeds up to 50MHz. Unlike most 8-bit microprocessors, which can only address 64KB, the eZ80 can address 16MB without a Memory Management unit. The eZ80 Webserver also features an Embedded Internet Software Suite that enables the transmission and reception of HTML form data and the dynamic generation of web pages.

FEATURES:
• 50MHz Processor • Multiply and Accumulate Engine • 16MB Linear Addressing • 3.3V Operation • 2 DMA Channels • Universal ZiLOG Interface (selectable UART, IIC, SPI) • 6 PRTs with Prescalers • 8KB SRAM • 32-Bit GPIO with Interrupt Support • On-Chip Oscillator • Optimized Pipeline Architecture • ZiLOG Debug Interface

EZ801900200ZCO

Contains an eZ80® Development Platform, an eZ80190 Module, a power supply, the ZPAKII Debug Interface Tool, and documentation on CDROM. For a product-specific listing of items in the kit, please see the Kit Contents sheet found inside this kit.

Z8Plus™ Microcontrollers

Employing the experience gained from the industry-standard Z80 and Z8 cores, the Z8Plus offers increased functionality, significantly higher performance, lower power requirements, and greater cost savings over other 8-bit microcontrollers. The Z8Plus is designed to be easy to use, even for designers who have never used a microcontroller before.

With single-cycle execution, powerful I/O capabilities and register-to-register architecture, the Z8Plus offers state-of-the-art flexibility and freedom for any designer in search of a low-cost solution for a variety of microcontroller applications.

The Z8Plus core offers several significant advantages compared to the current Z8 core. Foremost is performance improvement due to a reduced system clock division and a fixed instruction cycle time. The improvement is nearly 50%, depending upon instruction mix. For example, a Z8Plus-based part at 10MHz has performance comparable to a 16MHz part in production today. This, along with significant design improvements, leads to lower power and lower noise operation.

The Z8PE002 and Z8PE003 microcontrollers are the newest members of the popular Z8E001 Z8 Plus 8-bit microcontroller family. New features include voltage brown-out protection and power-on reset. Additionally, the "RESET" pin has been replaced with a general purpose I/O pin and oscillator circuitry to support RC configurations. These new parts are targeted at customers who require a powerful, yet small OTP microcontroller for use in general purpose applications.

PSoC® (Programmable System on Chip) Microcontrollers

The Programmable System-on-Chip (PSoC) microcontrollers integrate a microcontroller and the analog and digital components that typically surround it in an embedded system. Easy-to-use development tools enable designers to select the precise peripheral functionality they desire, including analog functions such as amplifiers, ADCs, DACs, filters and comparators and digital functions such as timers, counters, PWMs, SPI and UARTs. The PSoC family's analog features include rail-to-rail inputs, programmable gain amplifiers and up to 14-bit ADCs with exceptionally low noise, input leakage and voltage offset. PSoC devices include up to 32 KB of flash memory, 2 KB of SRAM, an 8x8 multiplier with 32-bit accumulator, power and sleep monitoring circuits, and hardware I2C USB and Capsense Technology communications. Operating Voltage from 2.4V to 5.25V. Temperature Range: -40°C ~ 85°C.

CPLDs

Cypress offers a wide range of Programmable Logic Devices From PALs with 10 macrocells and 200 gates up to CPLDs with 3072 macrocells and 200,000 gates.

Cypress also provides voltages ranging from 2.5V up to the typical 5.0V.

The Ultra37000™ family of CMOS CPLDs provides a range of high-density programmable logic solutions with unparalleled system performance. The Ultra37000 family is designed to bring the flexibility, ease of use, and performance of the 22V10 to high-density CPLDs. The architecture is based on a number of logic blocks that are connected by a Programmable Interconnect Matrix (PIM). Each logic block features its own product term array, product term allocator, and 16 macrocells. The PIM distributes signals from the logic block outputs and all input pins to the logic block inputs. All of the Ultra37000 devices are electrically erasable and In-System Reprogrammable (ISR).

The **Delta39K™ ISR™ CPLD** Family based on a 0.18 µm, six-layer metal CMOS logic process, offers a wide range of high-density solutions at unparalleled system performance. The Delta39K family is designed to combine the high speed, predictable timing, and ease of use of CPLDs with the high densities and low power of FPGAs. With devices ranging from 15,000 to 200,000 usable gates, the family features devices ten times the size of previously available CPLDs. Even at these large densities, the Delta39K family is fast enough to implement a fully synthesizable 64-bit, 66-MHz PCI core.

CY7C6XXX Series Of USB Microcontrollers

Cypress offers the industry's broadest line of USB microcontrollers, as well as a full set of development tools, supporting cost-driven applications such as keyboards and mice, as well as high-performance applications like printers, scanners, xDSL modems, and digital cameras. Cypress has a wide range of solutions for Low-Speed USB applications, Full-Speed USB Applications and USB Hub Applications. Temperature range, commercial (0°F ~ 70°F).

The CY7C63xxx is a family of 8-bit RISC One Time Programmable (OTP) microcontrollers. In addition, the microcontroller features 96 ~ 256 bytes of internal RAM depending on the device. The Cypress USB Controller accepts a 6-MHz ceramic resonator as its clock source. This clock signal is doubled within the chip to provide a 12-MHz clock for the microprocessor.

The CY7C64013 is an 8-bit One Time Programmable microcontroller that is designed for full-speed USB applications. The instruction set has been optimized specifically for USB operations, although the microcontrollers can be used for a variety of non-USB embedded applications.

The CY7C647XX (EZ-USB FX1™) is a family of full-speed highly integrated, USB microcontrollers. The FX1 family integrates the USB transceiver, serial interface engine (SIE), enhanced 8051 microcontroller, and a programmable peripheral interface in a single chip. The General Programmable Interface (GPIF) and Master/Slave Endpoint FIFO (8- or 16-bit data bus) provides an easy and glueless interface to popular interfaces such as ATA, UTOPIA, EPP, PCMCIA, and most DSP/processors.

The CY7C68013-56PVC (EZ-USB FX2) is a single-chip integrated USB 2.0 Transceiver, Serial Interface Engine (SIE), and Enhanced 8051 Microprocessor, High Speed 480Mbits/sec. Enhanced 8051 microcontroller, and a programmable peripheral interface in a single chip. Integrated I^{2}C-compatible controller, runs at 100 or 400 kHz, 48-MHz, 24 MHz, or 12 MHz 8051 operation. Four integrated FIFOs, brings glue and FIFO inside for lower system cost. Automatic conversion to and from 16-bit buses, master or slave operation. FIFOs can use externally supplied clock or asynchronous strobes. Easy interface to ASIC and DSP ICs, up to 40 general purpose I/Os.

The CY7C65 Series offers high-performance, fixed-function Universal Serial Bus (USB) hub devices which comply with USB Specification, Revision 1.1. Up to four downstream USB ports are available to expand the USB attachment points available in your PC system. These self-contained devices require no firmware development for your design, thereby reducing the design risk associated with some microcontroller solutions. These Application-Specific Standard Products (ASSP) can improve time-to-market in a number of USB designs, including standalone hubs, motherboard hubs, and monitor hubs.

The CY7C68001 (EZ-USB SX2™) USB interface device is designed to work with any external master, such as standard microprocessors, DSPs, ASICs, and FPGAs to enable USB 2.0 support for any peripheral design. SX2 has a built-in USB transceiver and Serial Interface Engine (SIE), along with a command decoder for sending and receiving USB data. The controller has four endpoints that share a 4-KB FIFO space for maximum flexibility and throughput, as well as Control Endpoint 0. SX2 has three address pins and a selectable 8- or 16- bit data bus for command and data input or output.

The SL811HS is a single-chip, dual-speed USB Embedded Host controller that can operate as either a USB Host or USB peripheral device. The SL811HS can interface to devices such as microprocessors, microcontrollers, DSPs or directly to a variety of buses such as ISA, PCMCIA and others.

The CY7C67300 (EZ-Host™) is Cypress Semiconductor's first full-speed, low-cost multiport host/peripheral controller. EZ-Host is designed to easily interface to most high-performance CPUs to add USB host functionality. EZ-Host has its own 16-bit RISC processor to act as a coprocessor or operate in standalone mode. EZ-Host also has a programmable I/O interface block allowing a wide range of interface options.

The Wireless enCoRe™ II family brings the features and benefits of the enCoRe™ II to non-USB applications. The enCoRe™ II family has an integrated oscillator that eliminates the external crystal or resonator, reducing overall cost. Also integrated into this chip are other external components such as wake-up circuitry.

Developer Kits

CY3674

The development kits for the EZ-USB FX1™ family provide complete hardware and software solutions for accelerating the firmware and device driver development for all the products in the family. The development kits use the actual silicon for the entire development. Cypress's software utilities and example of firmware allow the user to generate USB traffic in hours, not weeks! Cypress includes an evaluation version of the 8051 Keil Software Tools in the Full Speed USB 2.0 development kit. The evaluation version of the C-Compiler lets the designer write 8051 microcontroller applications in C and still get the efficiency and speed of assembly language. Advanced features from Keil Tools include the ability to single step through code. This makes it easy to detect errors, handle source level debugging, and set breakpoints. With the ability to debug code one line at a time and to quickly compile and one-step download new code, developers have a more efficient means to complete firmware faster than using emulators. The supplied Keil Tools are fully functional, but are limited in object size to 4 kilobytes.

Devices Supported: CY7C64713-56LFXC, CY7C64713-100AXC, CY7C64713-128AXC

Kit Includes: • EZ-USB Development Board with CY7C64713-128AXC • Peripheral Board for prototyping • USB cable • RS-232 9-pin to 9-pin cable

428-1681-ND	EZ-USB FX1 Development Kit	**$490.00**

CY3650

The Cypress USB Developer's Kit is a powerful tool that enables customers to develop USB hardware and firmware with emulated Cypress USB ICs. The development system can be run in two modes. In the typical development system environment, the board is controlled through a PC-based interface. Software running on the PC facilitates debugging through breakpoints, single stepping, and display and modification of registers and data RAM. In this mode, firmware can be implemented in on-board EPROM, or downloaded to program RAM. The RAM option provides a quick and easy method for testing firmware revisions.

Devices Supported: CY7C63101A-SC

Kit Includes: • CY3650 USB Development Board • Power supply • USB cable • RS-232 9-pin to 9-pin cable • 9-pin to 25-pin adapter

428-1342-ND	USB Development Kit-LO Speed, Low I/O	**$513.56**

DALLAS SEMICONDUCTOR

Microcontrollers 8-Bit 8051-Compatible

The 8051 microcontroller family remains one of the most popular processors in the world. Its ease of use and relatively high performance make it ideal for many applications, including portable and handheld products. The introduction of a new line of high-performance derivatives has many positive implications for improving the power efficiency of 8051-based designs. First, the use of a high-speed 8051 microcontroller can significantly improve power efficiency. A high performance CPU allows the processor clock to be slowed, resulting in the same level of performance at less power. Alternatively, the performance of an existing system can be increased without increasing power consumption. Second, a device which incorporates all needed peripherals should be selected if possible. This includes program memory, which is not commonly considered a peripheral. If extra data memory is required, a device such as the DS87C520 should be used, which incorporates 1 Kbyte of internal MOVX SRAM. One of the strengths of the 8051 product family is the wide variety of on-chip peripherals. Features such as watchdog timers, additional UARTs, and precision reset circuits are available on high-speed microcontrollers. The introduction of two new low-power modes provides a low-power alternative to the Idle mode. In addition to reducing current consumption, Power Management Modes such as those used in the DS87C520 High-Speed Microcontroller allow the processor to perform tasks such as polling while in a low state. Conventional 8051 architectures require the processor to operate at the maximum clock rate, even if only minimal processing power is required.

Soft Microcontroller Module

DS5000(T) Soft Microcontroller Module is a fully 8051-compatible 8-bit CMOS microcontroller that offers "softness" in all aspects of its application. This is accomplished through the comprehensive use of nonvolatile technology to preserve all information in the absence of system Vcc. The internal program/data memory space is implemented using either 8 or 32 K-bytes of nonvolatile CMOS SRAM. Internal data and key configuration registers are also nonvolatile. An optional real time clock gives permanently powered timekeeping. The clock keeps time to a hundredth of a second using an onboard crystal.

DS2250-32 has the same features as the DS5000 but with an added feature. The program/data memory space is implemented using 8, 32, or 64 Kbytes of nonvolatile CMOS SRAM. An optional real time clock gives permanently powered timekeeping. The clock keeps time to a hundredth of a second using an on-board crystal.
